SAFETY ALERT – SLIPPERY LOGS

The sap is running, and logs are very slippery at this time of year. Recent incidents have involved short export pruned logs. Well tapered, short logs squeeze out like 'pips' in a load, especially when most of their bark has been removed.

Loader Operators	Truck Drivers
Ensure that each load is well crowned	Stay in the cab or designated safe zone while loading is taking place
Ensure the truck loading area is level	Use a radio to communicate with loader driver and only approach once permission is received
Ensure that truck drivers and others remain in safe areas	Regularly check your load in your mirrors when driving
Provide a radio to truck drivers to communicate with you outside of their truck	Ensure that your load is restrained before leaving the loading site
